

Hands-on Lab: String Patterns, Sorting and Grouping in MySQL

Estimated time needed: 30 minutes

In this lab, you will learn how to create tables and load data in the MySQL database service using the phpMyAdmin graphical user interface (GUI) tool.

Objectives

After completing this lab, you will be able to:

- Filter the output of a SELECT query by using string patterns, ranges, or sets of values.
- Sort the result set of a query according to descending order in accordance with a pre-defined column.
- Group the outcomes of a query based on a selected parameter to further refine the response.

Software Used in this Lab

In this lab, you will use [MySQL](#), MySQL is a Relational Database Management System (RDBMS) designed to efficiently store, manipulate, and retrieve data.

To complete this lab you will utilize MySQL relational database service available as part of IBM Skills Network Labs (SN Labs) Cloud IDE. SN Labs is a virtual lab environment used in this course.

Database Used in this Lab

The database used in this lab is an internal database. You will be working on a sample HR database. This HR database schema consists of 5 tables called EMPLOYEES, JOB\_HISTORY, JOBS, DEPARTMENTS and LOCATIONS. Each table has a few rows of sample data. The following diagram shows the tables for the HR database:

Load the database

Using the skills acquired in the previous modules, you should first create the database in MySQL. Follow the steps below:

- Open the phpMyAdmin interface from the Skills Network Toolboxes in Cloud IDE.
- Create a blank database named "HR". Use the script shared in the link below to create the required tables.  
[Script to Create Tables.sql](#)
- Download the files in the links below to your local machine (if not already done in previous labs).  
[EMPLOYEES.sql](#)  
[JOB\\_HISTORY.sql](#)  
[JOBS.sql](#)  
[DEPARTMENTS.sql](#)  
[LOCATIONS.sql](#)
- Use each of these files to the interface to load data for respective tables in the "HR" database.

String Patterns

You can use string patterns to filter the responses of a query. Let's look at the following example:

Say you need to retrieve the first names `EMP` and last names `SON` of all employees who live in `11g`, `it`. You can use the `LIKE` operator to retrieve strings that contain the said text. The code will look as shown below.

## Grouping

In this exercise, you will go through some SQL problems on Grouping.

**NOTE:** The SQL problems in this exercise involve usage of SQL Aggregate functions AVG and COUNT. COUNT has been covered earlier. AVG is a function that can be used to calculate the Average or Mean of all values of a specified column in the result set. For example, to retrieve the average salary for all employees in the EMPLOYEES table, issue the query: `SELECT AVG(SALARY) FROM EMPLOYEES;`

A good example of grouping would be if For each department ID, we wish to retrieve the number of employees in the department.

```

```

1. SELECT DEP_ID, COUNT(*)
2. FROM EMPLOYEES
3. GROUP BY DEP_ID;

```

[Copy](#)

☐ Profiling [\[ Edit view \]](#) [\[ Edit \]](#) [\[ Explain SQL \]](#) [\[ Create PHP code \]](#) [\[ Refresh \]](#)

☐ Show all

[Data export](#)

DEP_ID	COUNT(*)
2	3
5	4
7	3

☐ Show all

Now, for each department, retrieve the number of employees in the department and the average employee salary in the department. For this, you can use COUNT(\*) to retrieve the total count of a column, and AVG() function to compute average salaries, and then GROUP BY

```

1. SELECT DEP_ID, COUNT(*), AVG(SALARY)
2. FROM EMPLOYEES
3. GROUP BY DEP_ID;

```

Execute update

	DEP_ID	COUNT(*)	AVG(SALARY)
2	3	66666	6666667
5	4	65000	6500000
7	5	66666	666667

You can refine your output by using appropriate labels for the columns of data retrieved. Label the computed column in the result set of the last problem as NUM\_EMPLOYEES and AVG\_SALARY.

```

```

You can also combine the usage of **GROUP BY** and **ORDER BY** statements to sort the output of each group in accordance with a specific parameter. It is important to note that in such a case, **ORDER BY** clause must be used after the **GROUP BY** clause. For example, we can sort the result of the previous query by average salary. The SQL query would thus become

834

In case you need to filter a grouped response, you have to use the **HAVING** clause. In the previous example, if we wish to limit the result to departments with fewer than 4 employees, we will have to use **HAVING** after the **GROUP BY**, and use the **count()** function in the **HAVING** clause instead of the column label.

## Practice Questions

1. Retrieve the list of all employees, first and last names, whose first names start with 'S'.

▼ [Click here for Solution](#)

```
1. 2
2. 2
3. 3

1. SELECT F_NAME, L_NAME
2. FROM EMPLOYEES
3. WHERE F_NAME LIKE 'K%';
```

Copy

2. Arrange all the records of the EMPLOYEES table in ascending order of the date of birth

2. Arrange all the records of the EMPLOYEES table in ascending order of the date of birth.

- [Click here for Solution](#)

```
1. 1
2. 2
3. 3

1. SELECT *
2. FROM EMPLOYEES
3. ORDER BY R_DATE;
```

Copyied!

3. Group the records in terms of the department IDs and filter them of ones that have average salary more than or equal to 60000. Display the department ID and the average salary.

▼ [Click here for Solution](#)

1. 1
2. 2
3. 3
4. 4

```
1. SELECT DEP_ID, AVG(SALARY)
2. FROM EMPLOYEES
3. GROUP BY DEP_ID
4. HAVING AVG(SALARY) >= 60000
```

Copied

4. For the problem above, sort the results for each group in descending order of average salary.

• [Click here for Solution](#)

- |               |               |
|---------------|---------------|
| $\frac{1}{2}$ | $\frac{1}{2}$ |
| $\frac{1}{2}$ | $\frac{1}{2}$ |

1. 2
2. 3
3. 4
4. 4
5. 5

```
1. SELECT DEP_ID, AVG(SALARY)
2. FROM EMPLOYEES
3. GROUP BY DEP_ID
4. HAVING AVG(SALARY) >= 60000
5. ORDER BY AVG(SALARY) DESC;
```

## Conclusion

Congratulations! You have completed this lab.

By the end of this lab, you will

- Use string patterns for filtering the data retrieved.
- Sort the data retrieved upon one or more parameters using **ORDER BY** statement.
- Group the data with respect to a parameter.
